CTZB live data feed: proposal for Joe

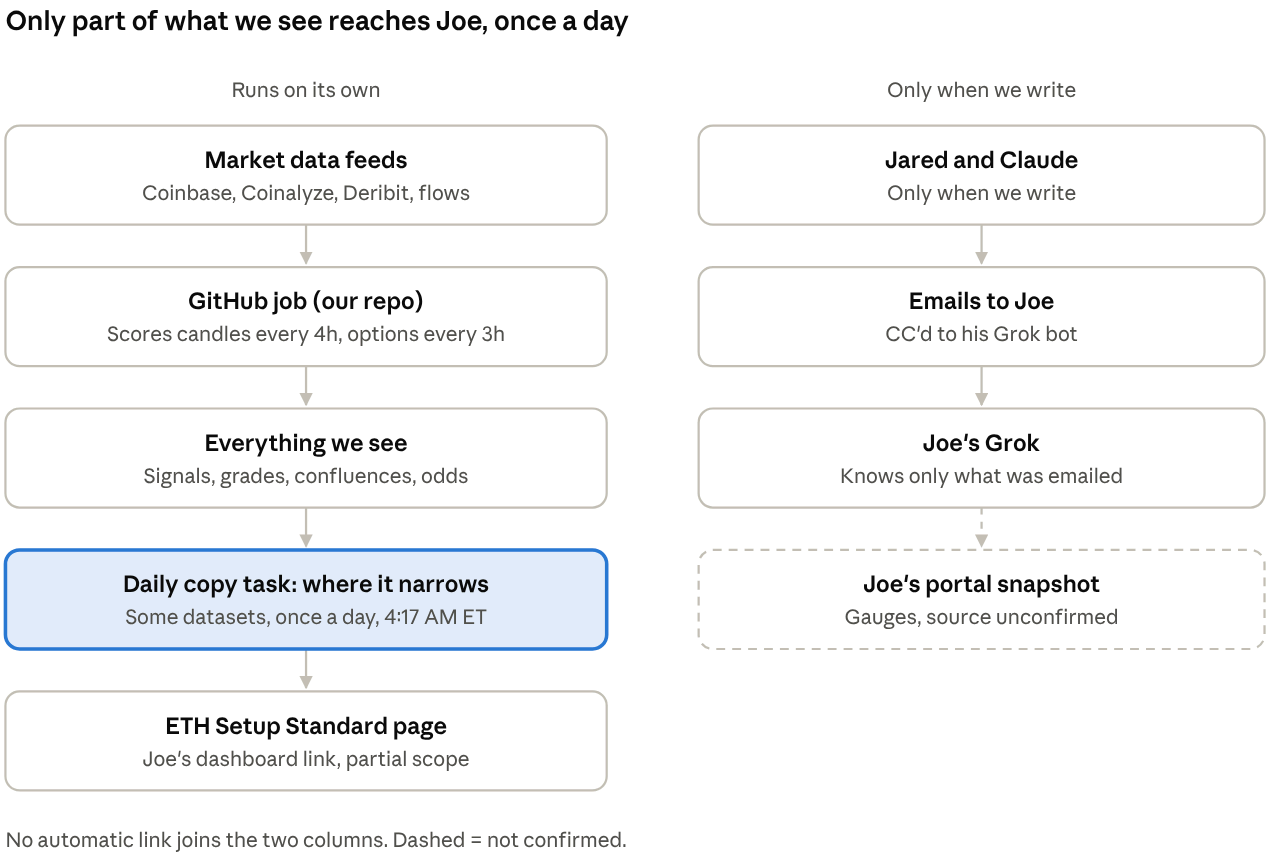

Oct 28, 2026 · @Jared

Purpose

Joe's side does not see the full scope we see, such as the confluences behind each signal. Our numbers and definitions change every few hours, but only part of them reaches his side, and nothing carries the rest across automatically.

This proposes one live feed that serves both the admin side and the member side from the same source, so nothing is rebuilt twice. Joe replied on 28 Oct with his lean on each decision; the last section records them. Nothing here is built yet.

How data moves today

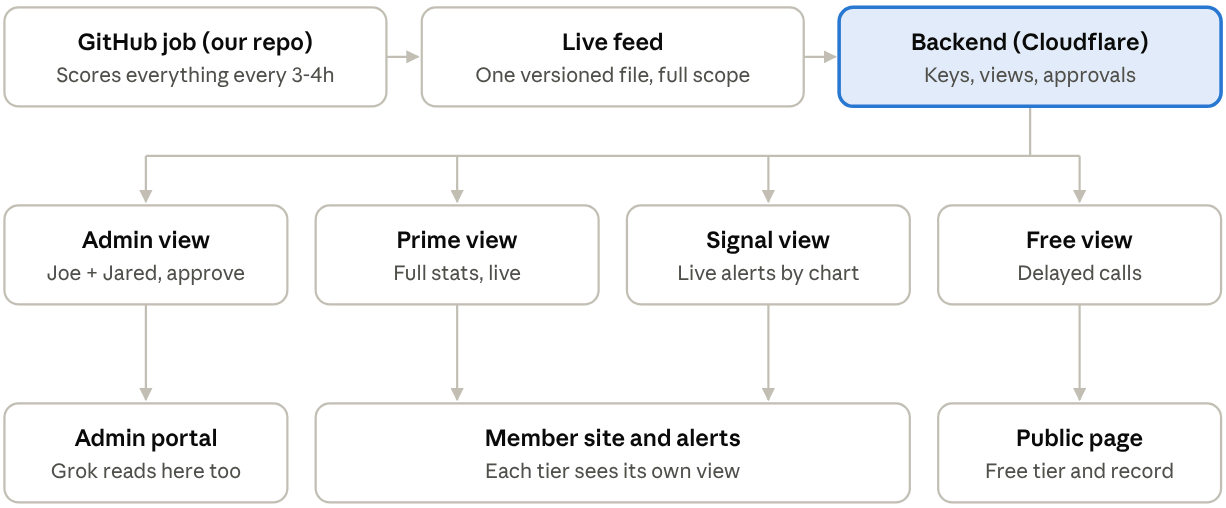

data flow today · two paths, no link between them

Our pipeline computes everything every few hours, but a once-a-day copy carries only part of it to Joe's dashboard. Grok only knows what we have emailed.

Proposal: one feed, one backend

Build it once and cut it into views per audience. A separate client-facing version would drift the first time we change a definition.

One feed, one backend: every screen reads from it

Every view is cut from the same feed, so no two screens can disagree.

proposed flow · one feed, four views

- **One source.** The job that already scores everything writes one complete feed every run: signals, grades, confluences, odds, drawdowns, regime, timestamps. A change we commit reaches every screen on the next run.
- **One small backend.** It stores the feed and serves one address per audience, behind keys. Paid views cannot sit on a public address.
- **Every screen reads; nothing is rebuilt.** Joe's admin portal, the member site, alerts (email first, Telegram once stable) and our ETH Setup Standard page all read their view.
- **Fixed format with a version number.** New fields are added, never renamed, so Joe's gauges and the member site do not break when we change things.
- **The repo goes private.** It is public today; the scheduled tasks that read it switch to a signed-in clone.

Approval, labels and the record

- **Approval is built in.** A new signal lands in the admin view as pending. Paid views see it only after Joe or Jared approves it; each approval is logged with who and when, and nothing is auto-approved.
- **Every record carries its label.** "Computed signal, not a fill. Entry quality only." The statistics describe entries. There is no exit in the data, so they are not a strategy return or a track record.
- **The public record comes free.** Every call is committed to git with a timestamp when it is made.
- **Jared's live trades are a separate stream.** They are logged from Coinbase for the Inner Table only, and are not part of this feed.

How the two AIs work together

Claude builds and changes the numbers; Grok reads them. Each change ships once, through the feed, and both sides see the same thing.

- **Claude** works on the research and the signal definitions in our repo. Every change reaches the feed on the next run.
- **Grok** reads the admin view with a read-only key, for Joe's summaries and questions. It no longer depends on what was in an email.
- **Emails carry discussion, not data.** No credentials go in any thread Grok reads; keys are handed over separately.
- **Open:** what format and update rate Grok wants.

Decisions

Joe's lean from his 28 Oct reply, as the starting point. Three items are still open.

Decision	Joe's lean (28 Oct)
Who builds what	Jared builds the live feed and backend; Joe's side builds the admin portal and member screens under ETHKROS, reviewed by Jared before launch
Where the backend runs	Cloudflare, account in ETHKROS's name, both as admins

Decision	Joe's lean (28 Oct)
Who approves a signal	Joe and Jared only; every approval logged; nothing auto-approved
Free tier delay	At least 24 hours, ideally until the entry window has closed
Alert channels at launch	Email and the member site; Telegram once stable. Live calls stay Inner Table only
What Grok reads	Read-only admin view, no write-back at launch; later notes or draft summaries, never approving or publishing

Still open: when the repo goes private (before paid views go live); what format and update rate Grok wants; when Telegram is added.
