CTZB Signal Tag Reference

Drawdowns and performance by marker type · ETH and BTC, 1D and 2D · bull windows only

★ GREEN STAR — diamond + WGMI timing below zero

CT/Stoch trough disagreement firing while global liquidity growth is decelerating. The only filter out of 92 tested that was positive on all four datasets. Best drawdown profile of any tag.

Chart	Trades	Win +15/-12	Exp. per trade	Win 60d	Median 60d	Upside 60d	Drawdown median	Drawdown 10th pct	Drawdown worst
ETH 1D	13	77%	+8.8%	69%	+12.7%	+42.8%	-9.2%	-34.8%	-47.0%
BTC 1D	13	69%	+6.7%	82%	+34.2%	+36.0%	-9.5%	-20.9%	-49.9%
ETH 2D	8	75%	+8.2%	89%	+32.6%	+53.3%	-8.4%	-21.8%	-28.4%
BTC 2D	10	70%	+6.9%	75%	+27.1%	+40.3%	-6.8%	-17.7%	-26.7%

◆ GOLD — diamond with the trough below 50

Disagreement where the CT RSI low printed under the neutral line. Bigger median moves on ETH than green, but less consistent across assets and a deeper worst case.

Chart	Trades	Win +15/-12	Exp. per trade	Win 60d	Median 60d	Upside 60d	Drawdown median	Drawdown 10th pct	Drawdown worst
ETH 1D	16	69%	+6.6%	90%	+38.4%	+50.3%	-7.1%	-16.9%	-47.0%
BTC 1D	16	56%	+3.2%	77%	+16.8%	+19.0%	-8.2%	-22.6%	-49.9%
ETH 2D	16	69%	+6.6%	82%	+29.3%	+43.6%	-8.0%	-34.0%	-49.6%
BTC 2D	19	79%	+9.3%	65%	+10.9%	+22.8%	-7.7%	-17.8%	-32.1%

HOLLOW — diamond with the trough at or above 50

The weak tag. Negative expectancy on BTC 2D (33% win) and the worst median drawdown anywhere. Treat as a plain bounce, not a diamond.

Chart	Trades	Win +15/-12	Exp. per trade	Win 60d	Median 60d	Upside 60d	Drawdown median	Drawdown 10th pct	Drawdown worst
ETH 1D	12	75%	+8.2%	71%	+9.5%	+31.9%	-14.4%	-35.4%	-48.9%
BTC 1D	10	50%	+3.9%	60%	+10.3%	+15.3%	-9.4%	-16.9%	-22.0%
ETH 2D	6	67%	+6.0%	100%	+31.1%	+38.0%	-7.0%	-21.8%	-23.8%
BTC 2D	12	33%	-3.0%	71%	+22.4%	+34.2%	-16.9%	-32.9%	-37.6%

A / B / C / D — plain zone bounce, no diamond

Every confirmed CT RSI trough. The baseline the tags above are measured against. Adds only 1–3 points over buying a random bar inside a bull window.

Chart	Trades	Win +15/-12	Exp. per trade	Win 60d	Median 60d	Upside 60d	Drawdown median	Drawdown 10th pct	Drawdown worst
ETH 1D	85	55%	+2.9%	68%	+14.8%	+30.8%	-13.2%	-38.3%	-67.3%
BTC 1D	49	47%	+1.2%	69%	+11.5%	+18.7%	-10.0%	-26.8%	-49.9%
ETH 2D	78	49%	+1.2%	68%	+16.0%	+33.6%	-14.2%	-37.0%	-63.3%
BTC 2D	75	56%	+3.1%	72%	+14.7%	+27.9%	-9.6%	-31.5%	-62.1%

How to read it

The two win columns answer different questions

Win +15/-12 is a race: did price gain 15% before it lost 12%? Trades are non-overlapping — a new signal is only taken once the previous one has resolved. Breakeven is 44%. **Exp. per trade** is the average outcome of that race.

Win 60d is simply whether price was higher 60 days later, with no stop. Signals here can overlap, so its sample is larger and the two columns will not agree.

The drawdown columns are the ones to plan around

Median is the typical worst dip you sit through in the 60 days after entry. **10th percentile** is the bad case that shows up roughly one trade in ten. **Worst** is the single deepest in the sample — treat it as what is possible rather than what is likely.

For sizing, the 10th percentile is the number that matters. A position that cannot survive it will be closed out of trades that would have worked.

What holds up and what does not

Green is the most consistent. 69–77% on the barrier test across all four datasets, with the shallowest median drawdowns (-6.8% to -9.5%).

Gold gives bigger ETH moves — +38.4% median at 60 days on ETH 1D versus green's +12.7% — but ranges from 56% to 79% on the barrier test depending on the chart.

Hollow is the one to skip. The only tag with a losing cell (BTC 2D, 33% win, -3.0% expectancy) and the deepest median drawdowns.

Limitations, stated plainly

Sample sizes are 6 to 23 trades per cell. Directional, not proven. Flipping two or three outcomes moves any of these numbers several points.

92 filters were tested. Requiring agreement across four datasets is a much harder bar than any single result, and only green cleared it — but the best of 92 is still the shape a false positive takes.

The WGMI liquidity data is revised after publication. M2 figures used in this backtest were not knowable in real time, so green's numbers are an upper bound rather than an estimate.

Everything above is conditional on the cycle filter. All measurements are inside bull windows anchored to Bitcoin all-time highs. Outside those windows the same signals run at 15–41%.

Data: COINBASE ETHUSD and BINANCE/COINBASE BTC, daily and 2-day bars, 2019–2026. Entries taken at the close of the confirmation bar, three bars after the RSI low. Past behaviour on historical data — not a forecast, not financial advice.
